2024/2/18

2

Syllabus

1	Course Overview & Review of MRI basic principles
2	Diffusion weighted imaging (DWI)
3	Diffusion tensor imaging (DTI) & tractography
4	MR angiography
5	MR contrast agent
6	MR perfusion: DCE & DSC
7	MR perfusion: arterial spin labeling (ASL)
8	Susceptibility weighted imaging (SWI)
9 (4/15)	MRI Examination Procedure
10 (4/22)	Yang-Ming 3T MRI room visiting and scanning
11	Functional MRI (fMRI) I
12 (5/6)	Functional MRI (fMRI) II (online video)
13	MR Spectroscopy (MRS)
14	Cardiac MR imaging
15	MR muscle skeleton imaging
16 (6/3)	Final Competition
17	端午節放假
18	Literature survey: MRI clinical research

<http://cflu.lab.nycu.edu.tw>, Textbook: MRI The Basics, Hashemi et al.

2024/2/18

7

Evaluation

- Attendance & participation in class activities (40%)
- 3T MRI visiting (30%)
- Final exam (30%)
 - Group competition.

Disease	Metabolic Changes
Brain tumors	Cho, NAA, Cr, Lac and Lip
Stroke	Lac, NAA, Glx, Cr, Cho
Epilepsy	NAA, Lac
Multiple sclerosis	NAA, Cho, (Cr)
HIV/AIDS	NAA, Cho, MI
Traumatic Brain Injury	NAA, Cho, Lac
Hepatic Encephalopathy	Cho, MI, Glx
Hypoxic Ischemic Injury	Lac, NAA, Glx, Cr
Neurodegenerative diseases	
Alzheimer	NAA, MI
Parkinson	NAA (Striatum)
Huntington	NAA, Cho (Basal ganglia)
ALS	NAA (Motor cortex, Brain stem)

Metabolite	Major resonance (ppm)	Significance	Visible only at short TE
Lipids (Lip)	0.8-1.4	Breakdown of tissue	Y
Lactate (Lac)	1.3	Marker of anaerobic glycolysis	N
NAA	2.0	Marker of neuronal health	N
Glutamate & Glutamine (Glx)	2.1-2.6	Excitatory neurotransmitter	Y
Cho	3.2	Marker of membrane metabolism, cell proliferation	N
Cr	3.0 (and 3.9)	Marker of cellular energetics	N
Myo-inositol (MI)	3.5	Osmolytic marker; proposed glial marker	Y

15

Procedure of MRI

- Alignment (magnetization) B_0
- Precession $\omega_0 = \gamma B_0$
- Resonance (given B_1 by RF with ω_2) $\omega_1 = \gamma B_1$, $B_1 \perp B_0$
 - The most effective resonance is produced when $\omega_0 = \omega_2$
- MR signal (EMF, relaxation time)
- Imaging (Pulse sequencing: SE, GRE, EPI)
 - Tissue Contrast: Image weighting
 - Spatial localization: Slice selection & Spatial Encoding
 - Data space/K space
- Tissue Suppression Techniques
- MR artifacts and safety issues

19

T1 & T2 Relaxation Time

T1:
 The longitudinal relaxation time
 The spin-lattice relaxation time
 $M_z(t) = M_0(1 - e^{-t/T1})$

T2:
 The transverse relaxation time
 The spin-spin relaxation time
 $M_{xy}(t) = M_0 e^{-t/T2}$

$T1 > T2 > T2^*$

<http://cflu.lab.nycu.edu.tw>, Textbook: MRI The Basics, Hashemi et al.

2024/2/18

20

Received Signal: Free Induction Decay

- The oscillating, decaying signal is called an FID.
- $M_{xy}(t) = M_0 e^{-t/T_2^*} (\cos \omega_0 t)$

The frequency of the received signal is also ω_0 .

TR (Repetition Time)

- To spatially encode the signal and to increase the signal-to-noise ratio, we have to apply the RF pulse *multiple times* while varying the gradients.
- The time interval between RF pulses is called TR.

TE (Time to Echo or Echo Delay Time)

- We wait a short period of time (TE) after RF pulse and then make the measurement.
- The T_2^* decay curve (FID) starts out at the value of $M_0(1 - e^{-TR/T_1})$ on the T_1 recovery curve and then decays very quickly.

Image Contrast

- Long TR, short TE \rightarrow proton density
- Long TR, long TE \rightarrow T_2^* -weighted
- Short TR, short TE \rightarrow T_1 -weighted
- Short TR, long TE \rightarrow no signal

Example:

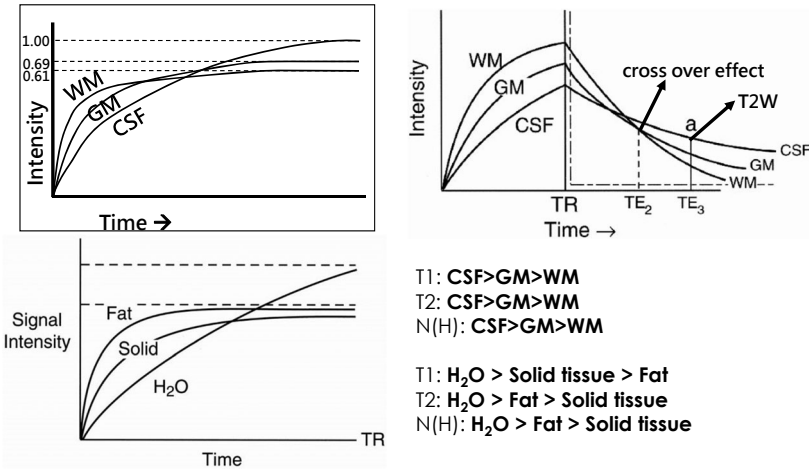

Long TR	2000 ms
Short TR	300–700 ms
Long TE	60 ms+
Short TE	10–25 ms

Table 2.3 Parameters used in gradient echo.

Weighting	TR	TE	Flip angle
T_1	short	short	large
T_2	long	long	small
Proton density	long	short	small

Adjust T1 and T2 weighting

T1/T2/PD weighted Images

Image Construction

1. Slice selection
(only excite spins on a specific slice location)
2. In-plane spatial encoding
(differentiate spin signals at different locations)

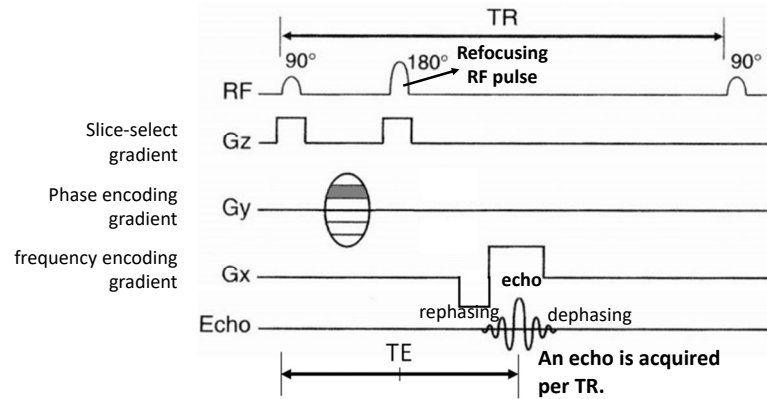

Image of K-Space

- The center of k-space contributes to the primary information of image.
- The periphery of k-space provides information regarding fitness of the image and clarity at sharp interfaces

Spin-echo pulse sequence diagram

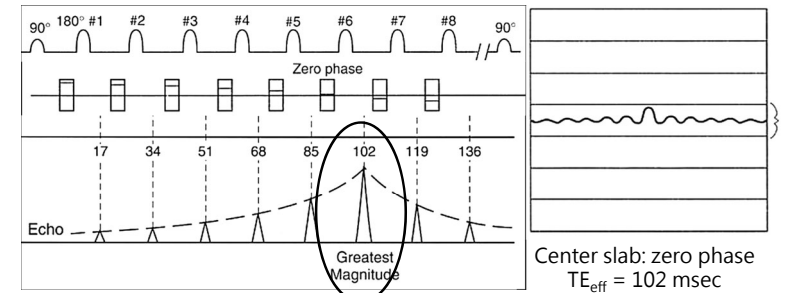

<http://cfliu.lab.nyu.edu.tw>, Textbook: MRI The Basics, Hashemi et al.

2024/2/18

29

Fast spin echo

- In FSE, before each 180° pulse, we place a different value of the phase-encoding gradient.
- For the 180° pulse before the echo we choose as the TE_{eff} (in this case, 102 msec), we use a phase-encoding gradient with the lowest strength.

<http://cfliu.lab.nyu.edu.tw>, Textbook: MRI The Basics, Hashemi et al.

2024/2/18

30

GRE Pulse Sequence Diagram

- Three operator-controlled parameters that affect the tissue contrast.

- Coherent GRE
- Incoherent GRE

<http://cfliu.lab.nyu.edu.tw>, Textbook: MRI The Basics, Hashemi et al.

2024/2/18

31

Single-shot EPI

- The phase-encode gradient is subsequently applied briefly during the time when the readout gradient was zero (200 μ sec).

<http://cfliu.lab.nyu.edu.tw>, Textbook: MRI The Basics, Hashemi et al.

2024/2/18

32

Contrast in EPI

- Contrast in EPI depends on the "root" pulsing sequence
- SE-EPI (90°-180°-EPI)
- GRE-EPI (α° -EPI)
- IR-EPI (180°-90°-180°-EPI)
 - inversion-recovery (IR)

Suppression techniques

- To suppress the signal coming from a certain tissue.
 - Two common targets (tissues): fat and water
- Suppression techniques
 - Inversion recovery (IR) techniques
 - Chemical/spectral saturation
 - Dixon method
 - Spatial presaturation
 - Magnetization transfer (MT)

Glioblastoma MRI

T2 Weighted image

T2 FLAIR (Water suppression)

edema vs. water

<http://journal.frontiersin.org/article/10.3389/fonc.2013.00066/full>

Breast cancer MRI

T1: $H_2O > \text{Solid tissue} > \text{Fat}$
 Gd contrast agent can shorten tissue T1
 Fat saturation + Gd enhancement

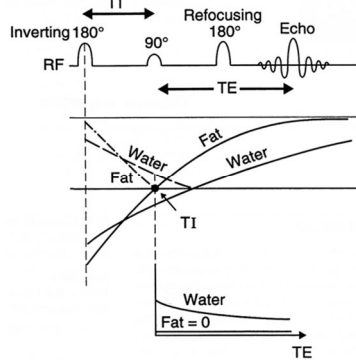

T1 Weighted image

British Journal of Cancer (2003) 88(1), 4-10

Inversion recovery, IR

- After the 180° RF pulse, the magnetization starts to recover from $-M_0$ instead of zero.
- $T1(\text{null}) = (ln2)T1 \approx 0.693 T1$.

<http://cflu.lab.nyu.edu.tw>, Textbook: MRI The Basics, Hashemi et al.

2024/2/18

37

Tissue Suppression: STIR & FLAIR

- STIR: Short tau inversion recovery, fat suppression
 - At 1.5T, $TI = 0.693 \times 200 = 138.6$ msec
- FLAIR: Fluid attenuated inversion recovery, water suppression
 - At 1.5T, $TI = 0.693 \times 3600 = 2494.8$ msec

T2 FLAIR
(Better differentiation for multiple sclerosis)

<http://cflu.lab.nyu.edu.tw>, Textbook: MRI The Basics, Hashemi et al.

2024/2/18

38

Water & fat chemical shift

- Peak location
 - Water 4.7 ppm
 - Fat (lipids) 1.3 ppm
 - ppm: parts per million
- $$\omega = 42.6 \times 1.5T = 63.9 \text{ MHz}$$

$$= 42.6 \times 3.0T = 127.8 \text{ MHz}$$
- 1.5T: $(4.7-1.3) \times 63.9 = 217.36$ Hz
 - 3.0T: $(4.7-1.3) \times 127.8 = 434.52$ Hz

<http://cflu.lab.nyu.edu.tw>, Textbook: MRI The Basics, Hashemi et al.

2024/2/18

39

Chemical/spectral presaturation

- A frequency-selective presaturation pulse is applied before the RF excitation pulse.
- CHESS: Chemical shift selective
- We select appropriate frequency (based on the Larmor equation) to suppress fat or water.

Fat sat 90° pulse

- At 1.5T, water protons precess 210-220 Hz faster than fat protons;
- At 3.0T, water protons precess 420-440 Hz faster than fat protons.

<http://mri-q.com/fat-sat-pulses.html>
