

醫用磁振學MRM 功能性磁振造影II functional MRI - Analyses

盧家鋒 助理教授

國立陽明大學 生物醫學影像暨放射科學系
alvin4016@ym.edu.tw

本週課程內容 <http://www.ym.edu.tw/~cflu>

- 功能性磁振造影原理回顧
- fMRI實驗設計
- 影像前處理流程/一般線性模型

- Functional Magnetic Resonance Imaging
 - Scott A. Huettel, Allen W. Song, Gregory McCarthy
- Introduction to Functional Magnetic Resonance Imaging (2nd edition)
 - Richard B. Buxton

<http://www.ym.edu.tw/~cflu>

4/27/2016 Lesson 11, Chia-Feng Lu

2

功能性磁振造影原理回顧

Review of fMRI Principles

<http://www.ym.edu.tw/~cflu>

4/27/2016 Lesson 11, Chia-Feng Lu

3

Neuronal activity and BOLD

- Blood-oxygenation level dependent (BOLD)
- BOLD fMRI detects the alterations in
 - The level of deoxygenated hemoglobin
 - Cerebral blood volume

Mandeville et al., MRM 1999.

<http://www.ym.edu.tw/~cflu>

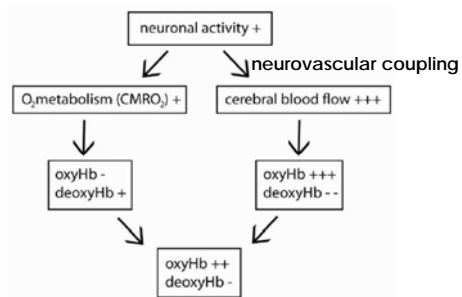

Arthurs et al., 2002.

4/27/2016 Lesson 11, Chia-Feng Lu

4

Metabolic and hemodynamic changes

- Mismatch between CBF and O₂ consumption
- Neural/Brain activation
 - Elevated oxy-Hb fraction
 - Decrease deoxy-Hb fraction

Neuroimaging – Methods, pp.53.

fMRI BOLD signal

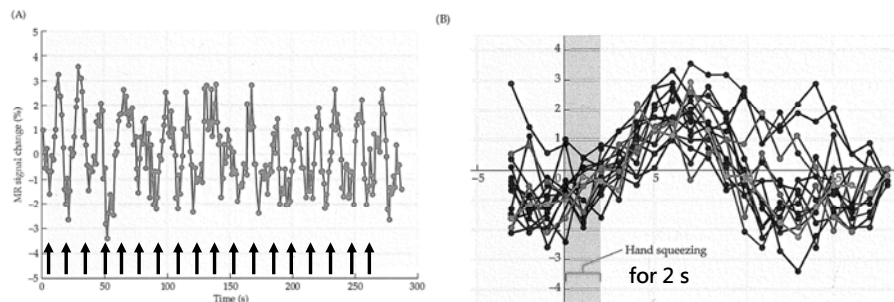

- t = 0s, a steady state in which there is a given amount of oxygenated and deoxygenated hemoglobin.
- t = 1s, an increased of deoxygenated hemoglobin due to the oxygen demands of neuronal activation.
- t = 6s, an increased of blood supply and oxygenated hemoglobin "flush away" the deoxygenated ones.

Matthijs Vink, Preprocessing and analysis of functional MRI data, 2007.

fMRI signal example

- A sample fMRI time course from a single voxel in the motor cortex during a task in which the subject squeezed her hand for 2 s every 16 to 18 s.

fMRI實驗設計

BOLD and HRF characteristics

- The relationship between neural activation and BOLD signal
 - Neuronal firing and postsynaptic potentials occur very soon (tens to hundreds of milliseconds)
 - BOLD: initial dip (~1s) → maximal value (~6s) → return to baseline (~20s)
- Hemodynamic response function (HRF)

Friston et al, Neuroimage, 1995, 1998.
<http://www.ym.edu.tw/~cflu>

4/27/2016 Lesson 11, Chia-Feng Lu

HRF and its derivatives

- The HRF characteristics can differ between
 - Brain regions within one subject (inter-region difference)
 - Subjects (inter-subject difference)
- The adaption of HRF in
 - The onset time (time derivative)
 - Dispersion/width of curve (dispersion derivative)

<http://www.ym.edu.tw/~cflu>

4/27/2016 Lesson 11, Chia-Feng Lu

Experimental design

- Block designs
 - Combine BOLD response to a number of continuous trials (events)
- Event-related (ER) designs
 - Obtain the BOLD response to a single event
- The more *efficient* a design, the less scan time is needed to achieve sufficient *power*.

<http://www.ym.edu.tw/~cflu>

4/27/2016 Lesson 11, Chia-Feng Lu

Design Types

▲ = trial of one type
 △ = trial of another

fMRI slides from <http://culhamlab.ssc.uwo.ca/fmri4newbies/Tutorials.html>
<http://www.ym.edu.tw/~cflu>

4/27/2016 Lesson 11, Chia-Feng Lu

Block designs

- A design in which the task is presented in so-called blocks (15~30s), alternated with resting blocks.
- The number of scans should be equal in all conditions, so that the variance in all factors is the same.
- The longer the blocks are, the more chance there is for a correlation with low-frequency noise.
- The strength of the brain signal can decrease over time.

Block designs

- Box-car function
 - A 0 for no-task and a 1 for task period
- Hemodynamic (BOLD) changes do not suddenly activate and stop activating in the way modelled by the box-car function
 - A better estimation by convolving the box-car input function with an hrf.

Matthijs Vink, Preprocessing and analysis of functional MRI data, 2007.

Pros & Cons of Block Designs

- high detection power of activated voxel/region
- has been the most widely used approach for fMRI studies
- accurate estimation of hemodynamic response function is not as critical as with event-related designs
- poor estimation power to differentiate the time courses in response to different conditions
- very predictable for subject
- Can't look at effects of single events
- becomes unmanagable with too many conditions (e.g., more than 4 conditions + baseline)

Slow Event-Related (ER) designs

Pros & Cons of Slow ER Designs

- excellent estimation of BOLD changes
- useful for studies with delay periods
- very useful for designs with motion artifacts because you can tease out artifacts
- poor detection power because of very few trials per condition
- subjects can get VERY bored and sleepy with long ITI.

How about making it fast?

fMRI slides from <http://culhamlab.ssc.uwo.ca/fmri4newbies/Tutorials.html>
<http://www.ym.edu.tw/~cflu>

4/27/2016 Lesson 11, Chia-Feng Lu

17

Linearity of BOLD signal

Linearity:
“Do things add up?”

red = 2 - 1

green = 3 - 2

Sync each trial response
to start of trial

Not quite linear but good enough!

Dale & Buckner, 1997

fMRI slides from <http://culhamlab.ssc.uwo.ca/fmri4newbies/>

4/27/2016 Lesson 11, Chia-Feng Lu

18

BOLD isn't totally linear

- Linearity of BOLD is sufficient for events with at least 4s of ITI.
- Phasic neural responses
- Adaption or habituation depends on stimulus duration and intensity.

Ganmor et al., 2010, Neuron

<http://www.ym.edu.tw/~cflu>

4/27/2016 Lesson 11, Chia-Feng Lu

19

Rapid Jittered Event-Related (ER) designs

fMRI slides from <http://culhamlab.ssc.uwo.ca/fmri4newbies/Tutorials.html>
<http://www.ym.edu.tw/~cflu>

4/27/2016 Lesson 11, Chia-Feng Lu

20

Why jitter?

- Yields larger fluctuations in signal

When pink is on, yellow is off
→ pink and yellow are anticorrelated

Includes cases when both pink and yellow are off
→ less anticorrelation

- Without jittering predictors from different trial types are strongly anticorrelated
 - As we know, the GLM doesn't do so well when predictors are correlated (or anticorrelated)

fMRI slides from <http://culhamlab.ssc.uwo.ca/fmri4newbies/Tutorials.html>
<http://www.ym.edu.tw/~cflu> 4/27/2016 Lesson 11, Chia-Feng Lu

21

Pros & Cons of Rapid-ER Designs

- high detection power
- trials can be put in unpredictable order
- subjects don't get so bored
- reduced detection compared to block designs
- requires stronger assumptions about linearity
 - BOLD is non-linear with inter-event intervals < 4 sec.
 - Nonlinearity becomes severe under 2 sec.
- errors in HRF model can introduce errors in activation estimates

fMRI slides from <http://culhamlab.ssc.uwo.ca/fmri4newbies/Tutorials.html>
<http://www.ym.edu.tw/~cflu> 4/27/2016 Lesson 11, Chia-Feng Lu

22

fMRI前處理流程

<http://www.ym.edu.tw/~cflu>

4/27/2016 Lesson 11, Chia-Feng Lu

23

Slice timing

Correction for slightly different imaging timing for multi-slice acquisition in a TR.

For example:
Acquire 5 slices in 1 TR
→ Temporal offset between slices

Sladky et al, NeuroImage 2011,58:588-594.

<http://www.ym.edu.tw/~cflu>

4/27/2016 Lesson 11, Chia-Feng Lu

24

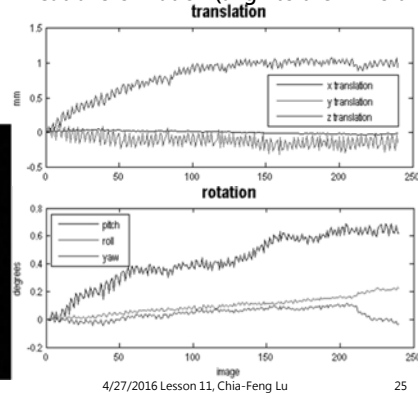

Realignment of head motion

- The signal variation from movement is larger than hemodynamic response.

An example:

6-parameter Rigid body registration & transformation (align to the 1st volume)

3 translations and 3 rotations

fMRI slides from <http://culhamlab.ssc.uwo.ca/fmri4newbies/Tutorials.html>

<http://www.ym.edu.tw/~cflu>

4/27/2016 Lesson 11, Chia-Feng Lu

26

EPI undistortion/unwarp

- Magnetic inhomogeneity can cause
 - Signal loss
 - Spatial distortion
- Magnetic field warps at tissue boundaries
 - The frontal pole, orbito-frontal cortex
 - Medial temporal lobe (hippocampus)
- The benefit of undistortion/unwarp
 - Make the shape of an individual's fMRI data more similar to their anatomical images.

4/27/2016 Lesson 11, Chia-Feng Lu

27

Co-registration

- Align fMRI (EPI) data with structural (T1) images.
 - Rigid body transformation using mutual information
 - Manual adjustment

<http://www.ym.edu.tw/~cflu>

4/27/2016 Lesson 11, Chia-Feng Lu

28

Normalization

- We can perform spatial normalization using either anatomical (T1) images or fMRI (EPI) data.

29

Problems with normalization

- The structural alignment does not guarantee the functional alignment.
- Differences between individuals in cortex anatomy and physiology can not be perfectly registered
 - Over-warping lead to meaningless distortion and unwanted features.
- Brain pathology (e.g. atrophy, brain injury, tumor) may confuse the normalizing procedure.

http://www.ym.edu.tw/~cflu

4/27/2016 Lesson 11, Chia-Feng Lu

30

Gaussian Smoothing

- Each voxel becomes weighted average of surrounding voxels.
- Render the data more normally distributed.
- Compensate for inaccuracies in normalization between individuals.
- Increase signal-to-noise ratio

http://www.ym.edu.tw/~cflu

4/27/2016 Lesson 11, Chia-Feng Lu

31

一般線性模型 General Linear Model, GLM

GLM & statistics for activation and group comparisons

http://www.ym.edu.tw/~cflu

4/27/2016 Lesson 11, Chia-Feng Lu

32

The Model

We have our set of hypothetical time-series
The estimation entails finding the parameter values such that the linear combination of these hypothetical time series "best" fits the data.

<http://www.ym.edu.tw/~cfli>

4/27/2016 Lesson 11, Chia-Feng Lu

33

Parameter Estimation

Finding the "best" parameter values
For a given voxel (time-series) we try to figure out just what type of voxel this is by "modelling" it as a linear combination of the hypothetical time-series.

<http://www.ym.edu.tw/~cfli>

4/27/2016 Lesson 11, Chia-Feng Lu

34

Parameter Estimation

Finding the "best" parameter values
For a given voxel (time-series) we try to figure out just what type of voxel this is by "modelling" it as a linear combination of the hypothetical time-series.
Beta value represents the association between a condition design and the measured BOLD signal.

<http://www.ym.edu.tw/~cfli>

4/27/2016 Lesson 11, Chia-Feng Lu

35

Parameter Estimation

Same model for all voxels.
Different parameters for each voxel. Beta map for each task condition

[ht](http://www.ym.edu.tw/~cfli)

T-test - one dimensional contrasts – SPM{t}

$$c^T = 1 \ 0 \ 0 \ 0 \ 0 \ 0 \ 0$$

$b_1 \ b_2 \ b_3 \ b_4 \ b_5 \dots$

Question: box-car amplitude > 0 ?
= $b_1 = c^T b > 0 ?$

Null hypothesis: $H_0: c^T b = 0$

contrast of estimated parameters

Test statistic:

$$T = \frac{\text{contrast of estimated parameters}}{\sqrt{\text{variance estimate}}}$$

$$T = \frac{c^T \hat{\beta}}{\sqrt{\text{var}(c^T \hat{\beta})}} = \frac{c^T \hat{\beta}}{\sqrt{\hat{\sigma}^2 c^T (X^T X)^{-1} c}} \sim t_{N-p}$$

<http://www.ym.edu.tw/~cfly>

4/27/2016 Lesson 11, Chia-Feng Lu

37

T-test: a simple example

Passive word listening versus rest

$$c^T = [1 \ 0]$$

<http://www.ym.edu.tw/~cfly>

Q: activation during listening?

Null hypothesis: $\beta_1 = 0$

$$t = \frac{c^T \hat{\beta}}{\text{Std}(c^T \hat{\beta})}$$

SPM results:
Height threshold $T = 3.2057$ ($p < 0.001$)
voxel-level

T	Z	p _{uncorrected}	mm	mm	mm
13.94	Inf	0.000	-63	-27	15
12.04	Inf	0.000	-48	-33	12
11.82	Inf	0.000	-66	-21	6
13.72	Inf	0.000	57	-21	12
12.29	Inf	0.000	63	-12	-3
9.89	7.83	0.000	57	-39	6
7.39	6.36	0.000	36	-30	-15
6.84	5.99	0.000	51	0	48
6.36	5.65	0.000	-63	-54	-3
6.19	5.53	0.000	-30	-33	-18
5.96	5.36	0.000	36	-27	9
5.84	5.27	0.000	-45	42	9
5.44	4.97	0.000	48	27	24
5.32	4.87	0.000	36	-27	42

4/27/2016 Lesson 11, Chia-Feng Lu

38

THE END

alvin4016@ym.edu.tw

<http://www.ym.edu.tw/~cfly>

4/27/2016 Lesson 11, Chia-Feng Lu

39
